- Dashboard

This is the webpage: <https://portal.azure.com/#home>
I sign in to the Azure portal with my JCCC email account.

Step 2 – Create a Resource Group

Notes

The screenshot shows the Microsoft Azure portal home page. At the top, there is a navigation bar with the Microsoft Azure logo, a search bar, and user information for 'fasto@stumail.jccc.edu'. Below the navigation bar, there are two main sections: 'Azure services' and 'Navigate'. The 'Azure services' section contains icons for 'Create a resource', 'Education', 'Subscriptions', 'Virtual machines', 'Quickstart Center', 'Azure AI services', 'Kubernetes services', 'App Services', 'Storage accounts', and 'More services'. The 'Navigate' section contains icons for 'Subscriptions', 'Resource groups', 'All resources', and 'Dashboard'. The 'Resource groups' icon is highlighted with a red box.

I click on the Resource groups icon at the bottom of the page. Then I click on the +Create button.

The screenshot shows the Microsoft Azure portal 'Resource groups' page. The page title is 'Resource groups' and it is for 'Johnson County Community College (jccc.edu)'. Below the title, there are several action buttons: '+ Create', 'Manage view', 'Refresh', 'Export to CSV', 'Open query', and 'Assign tags'. There is also a filter section with a search box and two active filters: 'Subscription equals all' and 'Location equals all'. Below the filter section, there is a message 'Showing 0 to 0 of 0 records.' and two dropdown menus: 'No grouping' and 'List view'. At the bottom of the page, there is a large icon of a resource group and the text 'No resource groups to display' followed by 'Try changing or clearing your filters.' and a '+ Create' button, which is highlighted with a red box.

Step 2 – Create a Resource Group - continue

Notes

The screenshot shows the 'Create a resource group' page in the Microsoft Azure portal. The user is logged in as 'fasto@stumail.jccc.edu'. The page title is 'Create a resource group'. The 'Basics' tab is selected. The 'Project details' section contains the following fields:

- Subscription: Azure for Students
- Resource group: ResourceGroupDS280
- Region: (US) East US

The 'Resource details' section is partially visible at the bottom.

I choose my subscription: Azure for Students.
I name my resource group.
I choose my region: (US) East US.
Then I click Next: Tags.
I name it Assignment in Name.
I name it DS280 Project in Value.
Then I click Next.

The screenshot shows the 'Create a resource group' page in the Microsoft Azure portal, now on the 'Tags' tab. The user is logged in as 'fasto@stumail.jccc.edu'. The page title is 'Create a resource group'. The 'Tags' tab is selected. The instructions state: 'Apply tags to your Azure resources to logically organize them by categories. A tag consists of a key (name) and a value. Tag names are case-insensitive and tag values are case-sensitive. Learn more'. The table below shows the tags being added:

Name	Value	Resource
Assignment	DS280 Project	Resource group
		Resource group

Step 2 – Create a Resource Group – continue

Create a storage account

Basics | Advanced | Networking | Data protection | Encryption | Tags | Review + create

Azure Storage is a Microsoft-managed service providing cloud storage that is highly available, secure, durable, scalable, and redundant. Azure Storage includes Azure Blobs (objects), Azure Data Lake Storage Gen2, Azure Files, Azure Queues, and Azure Tables. The cost of your storage account depends on the usage and the options you choose below. [Learn more about Azure storage accounts](#)

Project details

Select the subscription in which to create the new storage account. Choose a new or existing resource group to organize and manage your storage account together with other resources.

Subscription * Azure for Students

Resource group * ResourceGroupDS280
[Create new](#)

Instance details

Storage account name * ① storage1

Region * ① (US) East US
[Deploy to an Azure Extended Zone](#)

Performance * ①

Standard: Recommended for most scenarios (general-purpose v2 account)

Premium: Recommended for scenarios that require low latency.

Redundancy * ① Locally-redundant storage (LRS)

I name my storage account.
For Redundancy, I choose Locally-redundant storage (LRS).
I don't modify anything else.
I click Next.
I keep the default settings for:

- Advanced
- Networking
- Data protection
- Encryption
- Tags

Step 3 – Create a Storage Account – continue

Notes

Microsoft Azure portal navigation: Home > Create a resource > Marketplace > Create a storage account

Navigation tabs: Basics, Advanced, Networking, Data protection, Encryption, Tags, **Review + create**

[View automation template](#)

Basics

Subscription	Azure for Students

Location	East US
Storage account name	storagefrankds280
Performance	Standard
Replication	Locally-redundant storage (LRS)

Advanced

Enable hierarchical namespace	Disabled
Enable SFTP	Disabled
Enable network file system v3	Disabled
Allow cross-tenant replication	Disabled
Access tier	Hot
Enable large file shares	Enabled

Security

Secure transfer	Enabled
Blob anonymous access	Disabled
Allow storage account key access	Enabled
Default to Microsoft Entra authorization in the Azure portal	Disabled
Minimum TLS version	Version 1.2
Permitted scope for copy operations (preview)	From any storage account

Networking

Network connectivity	Public endpoint (all networks)
Default routing tier	Microsoft network routing

Data protection

Navigation buttons: Previous, Next, **Create**, Give feedback

Then I click the Create button.

Step 3 – Create a Storage Account – continue

Notes

The screenshot shows the Microsoft Azure portal interface. At the top, the navigation bar includes the Microsoft Azure logo, a search bar, and user information for 'fasto@stumail.jccc.edu'. The main content area displays the 'Overview' page for a deployment named 'storagefrankds280_1721342915272'. A green checkmark icon indicates that the deployment is complete. The deployment details include the name, subscription ('Azure for Students'), resource group ('ResourceGroupDS280'), and start time ('7/18/2024, 7:47:17 PM'). A 'Go to resource' button is visible. On the right side, there are three promotional cards: 'Cost Management' (with a dollar sign icon), 'Microsoft Defender for Cloud' (with a shield icon), and 'Free Microsoft tutorials' (with a play icon). A 'Work with an expert' section is also present at the bottom right.

I have created a storage account.

Step 4 – Upload the JSON File

Notes

The screenshot displays the Azure portal interface for a storage account. The left navigation pane includes 'Containers', which is highlighted with a red box. The main content area shows the following settings:

Category	Setting	Value
Blob service	Hierarchical namespace	Disabled
	Default access tier	Hot
	Blob anonymous access	Disabled
	Blob soft delete	Enabled (7 days)
	Container soft delete	Enabled (7 days)
	Versioning	Disabled
	Change feed	Disabled
Security	Require secure transfer for REST API operations	Enabled
	Storage account key access	Enabled
	Minimum TLS version	Version 1.2
	Infrastructure encryption	Disabled
Networking	Allow access from	All networks
	Number of private endpoint connections	0
	Network routing	Microsoft network routing
	Access for trusted Microsoft services	Yes

I go to Resource groups.
I click on my resource group.
I click on my storage account.
On the left side, I click on Containers.

Step 4 – Upload the JSON File - continue

Notes

The screenshot shows the Microsoft Azure portal interface. The main navigation pane on the left lists various services, with 'Containers' selected. The main content area displays the 'storagefrankds280 | Containers' page. A '+ Container' button is highlighted with a red box. The 'New container' dialog box is open on the right, showing the 'Name' field set to 'containerds280' (highlighted with a red box) and the 'Anonymous access level' set to 'Private (no anonymous access)'. A blue information box states: 'The access level is set to private because anonymous access is disabled on this storage account.' The 'Create' button at the bottom of the dialog is also highlighted with a red box.

I click on the + Container icon.
I give it a name on the right side.
Then I click the Create button.
Now I have created a container.
I click on my container.

Step 4 – Upload the JSON File - continue

Notes

The screenshot shows the Microsoft Azure portal interface. The top navigation bar includes the Microsoft Azure logo, an 'Upgrade' button, a search bar, and user information for 'fasto@stumail.jccc.edu'. The main content area is divided into two panels. The left panel shows the 'containerds280' container overview, with the 'Upload' button highlighted by a red box. The right panel is the 'Upload blob' dialog box, which displays '1 file(s) selected: VolcanoData.json' and a red box around the 'Browse for files' link. Below the dialog box, there is an 'Upload' button and a 'Give feedback' link.

I click the upload icon at the top.
On the right side, I click "Browse for files."
Then I click the upload button.
I have just uploaded the JSON file into my container,
which is in my storage account, which is in my
resource group.

Step 5 – Create a Cosmos DB

Create an Azure Cosmos DB account

Which API best suits your workload?

Azure Cosmos DB is a fully managed NoSQL and relational database service for building scalable, high performance applications. To start, select the API to create a new account. The API selection cannot be changed after account creation.

Azure Cosmos DB for NoSQL
Azure Cosmos DB's core, or native API for working with documents. Supports fast, flexible development with familiar SQL query language and client libraries for .NET, JavaScript, Python, and Java.
Create Learn more

Azure Cosmos DB for PostgreSQL
Fully-managed relational database service for PostgreSQL with distributed query execution, powered by the Citus open source extension. Build new apps on single or multi-node clusters—with support for JSONB, geospatial, rich indexing, and high-performance scale-out.
Create Learn more

Azure Cosmos DB for MongoDB
Fully managed database service for apps written for MongoDB. Recommended if you have existing MongoDB workloads that you plan to migrate to Azure Cosmos DB.
Create Learn more

Azure Cosmos DB for Apache Cassandra
Fully managed Cassandra database service for apps written for Apache Cassandra. Recommended if you have existing Cassandra workloads that you plan to migrate to Azure Cosmos DB.
Create Learn more

Azure Cosmos DB for Table
Fully managed database service for apps written for Azure Table storage. Recommended if you have existing Azure Table storage workloads that you plan to migrate to Azure Cosmos DB.
Create Learn more

Azure Cosmos DB for Apache Gremlin
Fully managed graph database service using the Gremlin query language, based on Apache TinkerPop project. Recommended for new workloads that need to store relationships between data.
Create Learn more

I click on the “+ Create a resource” icon at the top left. Then I search for “Cosmos DB.” I click the Create Azure Cosmos DB account button. Next, I choose Azure Cosmos DB for No SQL and click Create.

No data to display

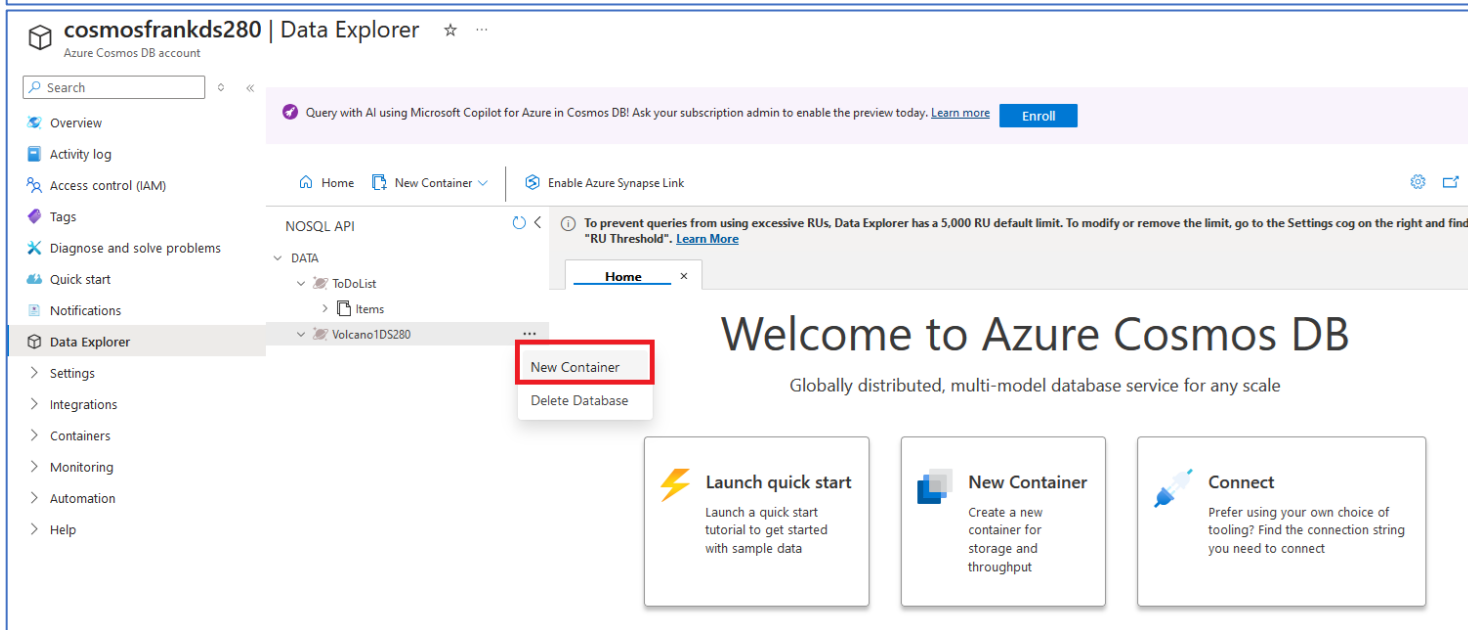

Then, I go back to my Cosmos DB account.
I click on "Data Explorer" on the left.

Step 5 – Create a Cosmos DB - continue

Notes

I click on “New Container” and select “New Database.”
I name my new database.
Then I click on my new database and choose “New Container.”

Step 5 – Create a Cosmos DB - continue

Notes

The screenshot shows the 'New Container' dialog in the Azure Cosmos DB Data Explorer. The dialog is titled 'New Container' and is open over a database named 'Volcano1DS280'. The 'Database id' field is set to 'Volcano1DS280' and 'Use existing' is selected. The 'Container id' field is 'Volcano1' and the 'Partition key' is '/id'. The 'Add hierarchical partition key' button is visible. The 'Analytical store' is set to 'Off'. The 'Advanced' section is expanded, showing a checkbox for 'My application uses an older Cosmos .NET or Java SDK version' which is unchecked. A note below states: 'To ensure compatibility with older SDKs, the created container will use a legacy partitioning scheme that supports partition key values of size only up to 101 bytes. If this is enabled, you will not be able to use hierarchical partition keys.'

Then I use my existing database name.
I name my container.
I choose “/id” as the partition key and keep the default settings.
Then I click OK.

Step 5 – Create a Cosmos DB - continue

Notes

The screenshot shows the Microsoft Azure Data Explorer interface for a Cosmos DB instance named 'cosmosfrankds280'. The left sidebar contains navigation options like Overview, Activity log, and Data Explorer. The main area displays a SQL query: 'SELECT * FROM c' with a filter 'id' selected. The 'Upload Items' dialog box is open on the right, showing a file selection field with 'VolcanoData.json' entered. The 'Upload' button at the bottom of the dialog is highlighted with a red box. In the top toolbar, the 'Upload Item' button is also highlighted with a red box.

I choose my database name on the left.
I open my container.
I click on "Items."
Then I click on "Upload item" at the top.
I find my file and upload it.

Step 5 – Create a Cosmos DB - continue

Notes

The screenshot shows the Microsoft Azure Data Explorer interface for the 'cosmosfrankds280' account. The left sidebar contains navigation options like Overview, Activity log, and Data Explorer. The main area displays a table of data with columns 'id' and '/id'. A specific record is selected, and its details are shown in a JSON format on the right.

22 }
```

I click the refresh icon under “Edit Filter.”
Then I see my data displayed in an organized way.

Step 5 – Create a Cosmos DB - continue

Notes

The screenshot shows the Azure Cosmos DB Data Explorer interface. The top navigation bar includes a search box, a home button, a 'New Container' button (highlighted with a red box), and an 'Enable Azure Synapse Link' button. The left sidebar contains navigation options: Overview, Activity log, Access control (IAM), Tags, Diagnose and solve problems, Quick start, Notifications, and Data Explorer. Under 'Data Explorer', there are sub-options: Settings, Integrations, Containers, Monitoring, Automation, and Help. The main content area displays a 'Welcome to Azure Cosmos DB' message and several cards: 'Launch quick start', 'New Container', 'Recents' (listing 'Volcano1' and 'Items' containers), and 'Top 3 things you need to know' (listing 'Advanced Modeling Patterns', 'Partitioning Best Practices', and 'Plan Your Resource Requirements'). A 'New Database' dialog box is open in the foreground, with its title bar and the 'Database id' field (containing 'VolcanoDS280PowerAutomate') highlighted with a red box. An 'OK' button is visible at the bottom of the dialog.

First I click on “New Database”
I give it a name to my new database.

Step 5 – Create a Cosmos DB - continue

Notes

The screenshot shows the Azure Cosmos DB Data Explorer interface. The 'New Container' dialog box is open, and its fields are highlighted with a red border. The dialog box contains the following fields and options:

- Database id:** A dropdown menu with the value 'VolcanoDS280PowerAutomate' selected.
- Container id:** A text input field with the value 'VolcanoPowerAutomate' entered.
- Partition key:** A text input field with the value '/id' entered.
- Unique keys:** A section with a plus icon and the text 'Add unique key'.
- Analytical store:** A section with radio buttons for 'On' and 'Off', with 'Off' selected.
- Advanced:** A section with an expandable arrow and the text 'Advanced'.

The background of the Data Explorer shows a 'Welcome to Azure Cosmos DB' message and a 'New Container' button in the top navigation bar.

Now I create a "New Container."
I choose my database.
I give a name in "Container id."
I set the Partition key to "/id."
I keep the default settings for the rest.
Then I click OK.

Step 6 – Create a Power Automate Flow

Notes

The screenshot shows the Microsoft Power Automate interface. On the left sidebar, the '+ Create' button is highlighted with a red box. In the main area, the 'Instant cloud flow' option is highlighted with a red box. A modal window titled 'Build an instant cloud flow' is open, showing a 'Flow name' input field (highlighted with a red box) and a list of triggers under 'Choose how to trigger this flow *'. The 'Manually trigger a flow' option is selected and highlighted with a red box. The 'Create' button at the bottom of the modal is also highlighted with a red box.

First, I go to the Microsoft Power Automate website. I sign in with my student account. I click "+ Create" on the left. I select "Instant cloud flow." I click "Manually trigger a flow." I enter a name in the flow name field. Then I click the Create button.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot displays the Microsoft Power Automate interface. At the top, the header includes the Johnson County Community College logo, the text "Power Automate", a search bar, and environment information for "Johnson County Cc". Below the header, a navigation bar shows "cloudflow2" and various utility icons like "Send feedback", "Copilot", "Save", "Flow checker", "Test", and "New designer".

The main workspace is divided into two panels. The left panel, titled "Get blob content (V2)", contains configuration options for the action. A red rectangular box highlights the "Storage Account Name Or Blob Endpoint *" section, which includes a dropdown menu set to "Use connection settings(storagefrankds280)" and a "Blob *" field containing the path "/containerds280/VolcanoData.json". Below this, there are sections for "Advanced parameters" (set to "Showing 1 of 1") and "Infer Content Type" (set to "Yes"). At the bottom of the left panel, it indicates the flow is "Connected to connectionblob" with a "Change connection" link.

The right panel shows a flow canvas with a grid background. It contains two action boxes: "Manually trigger a flow" at the top and "Get blob content (V2)" below it. A red square highlights a plus sign icon (+) located between the two action boxes, indicating the point where a new action is being added to the flow.

I click on the "+" to add an action.
I search for Blob Storage and select "Get blob content (V2)."
I choose my storage account.
I select the data inside my container.
Then I click "Save" at the top.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot shows the Power Automate interface. The top navigation bar includes the Johnson County Community College logo, 'Power Automate' text, a search bar, and environment information for 'Johnson County Cc'. Below the navigation bar, there are utility buttons for 'Send feedback', 'Copilot', 'Save', 'Flow checker', 'Test', and a 'New designer' toggle. The main workspace is split into two panes. The left pane shows the configuration for an 'Initialize variable' action. The 'Name' field is set to 'jsonString', the 'Type' is set to 'String', and the 'Value' is set to 'File Content'. A red box highlights the 'Name', 'Type', and 'Value' fields. The right pane shows a flow canvas with three actions: 'Manually trigger a flow', 'Get blob content (V2)', and 'Initialize variable'. A red box highlights the 'Initialize variable' action in the flow.

I click on the “+” to add an action.
I search for “variable” and choose “Initialize variable.”
I give it a name.
I set the Type to “String.”
I set the Value to “File Content.”
Then I click “Save” at the top.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot shows the Power Automate interface for configuring a 'Parse JSON' action. The 'Content' field is set to 'jsonString'. The 'Schema' field has a button labeled 'Use sample payload to generate schema'. A search window is open, showing 'Variables' selected with 'jsonString' as the type.

I click on the “+” to add an action.

I search for “Data Operation” and choose “Parse JSON.”

In Content, I select “jsonString.”

I click on “Use sample payload to generate schema” and add some of my JSON data.

I click “Done.”

In the Schema, I modify “Elevation” to:

```
"Elevation": {  
  "type": [  
    "integer",  
    "null"  
  ]  
},
```

I click “Save” at the top.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot displays the Microsoft Power Automate interface. At the top, the header includes the Johnson County Community College logo, the text 'Power Automate', a search bar, and environment information for 'Johnson County Cc'. Below the header, a navigation bar contains icons for 'Send feedback', 'Copilot', 'Save', 'Flow checker', 'Test', and 'New designer'. A green notification bar at the top left states 'Your flow is ready to go. We recommend you test it.' The main workspace is divided into two panes. The left pane shows the configuration for the 'Create or update document (V3)' action, with a red box highlighting the 'Body' field. The 'Body' field is set to 'Body Item'. The right pane shows a flow diagram with the following steps: 'Manually trigger a flow', 'Get blob content (V2)', 'Initialize variable', 'Parse JSON', and a 'For each' loop containing the 'Create or update document (V3)' action. A red box highlights the 'For each' loop and its contents.

I search for “Cosmos DB” and choose “Create or update document (V3).”
I select my Cosmos account.
I choose my Cosmos database ID.
I select my Cosmos container “Collection ID.”
I choose “Body Item” in Body.
Then I click “Save” at the top.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot displays the Microsoft Power Automate interface for a flow named "cloudflow2". The flow is in the "Run flow" state, and the "Continue" button is highlighted with a red box. The flow steps are as follows:

- Manually trigger a flow
- Get blob content (V2)
- Initialize variable
- Parse JSON
- For each
- Create or update document (V3)

The left sidebar shows the "Parameters" tab for the "Create or update document (V3)" step, with the following values:

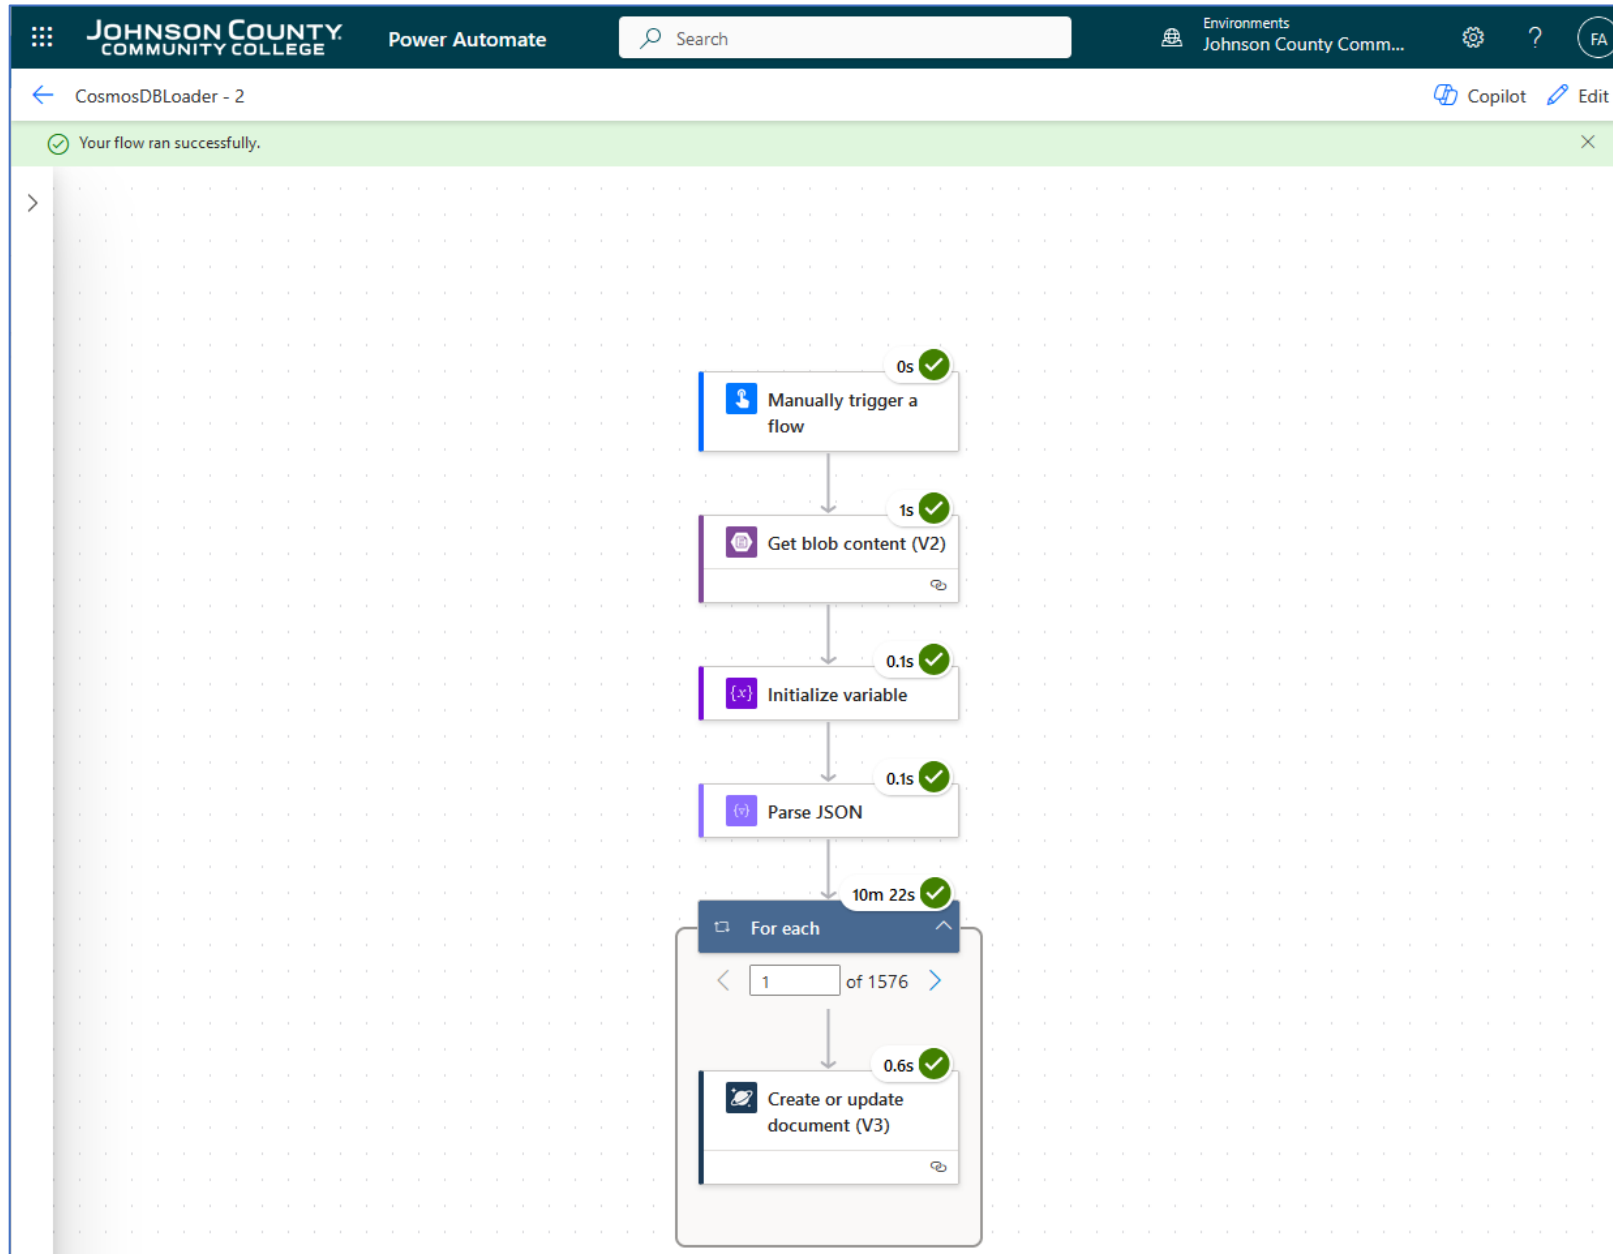

- Azure Cosmos DB Account Name *: AccountNameFromSettings
- Database ID *: VolcanoDS280PowerAutomate
- Collection ID *: VolcanoPowerAutomate
- Body *: Current item

The right sidebar shows the "Run flow" dialog, which includes the flow name "cloudflow2", the owner "Frank Asto (Student)", and a list of connected apps: Azure Blob Storage and Azure Cosmos DB, both with green checkmarks indicating they are ready to go.

I click "Test" at the top.
I select "Manually" at the top.
I click the Test button at the bottom.
I click "Continue."
I click on "Run flow."

Step 6 – Create a Power Automate Flow - continue

Notes

After I run the test, I go back to Azure.
I open my Cosmos DB container and check if my new data is there.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot shows the Azure Cosmos DB Data Explorer interface. The left sidebar displays the database structure, with the 'VolcanoDS280PowerAutomate' container and its 'Items' collection highlighted in red. The main area shows a table of items with columns 'id' and '/id'. The first row is selected. To the right, a JSON document is displayed, representing a volcano record with fields like 'Volcano Name', 'Country', 'Region', 'Location', 'Elevation', and 'Status'.

19  "_etag": "\"730021d7-0000-0300-0000-669c83110000\"",
20  "_attachments": "attachments/",
21  "_ts": 1721533201
22 }
```

I see the JSON file in my container in Cosmos DB.
I check my database.

Step 6 – Create a Power Automate Flow - continue

Notes

The screenshot displays the Microsoft Azure Data Explorer interface. The top navigation bar includes the Microsoft Azure logo, a search bar, and user information for 'fasto@stumail.jccc.edu'. The main content area shows the 'cosmosfrankds280' account with a 'DATA' sidebar on the left. A red box highlights the 'New SQL Query' icon in the top toolbar. Another red box highlights the 'VolcanoPowerAutomate' folder in the sidebar. The central query editor contains the following SQL code:

```
1 SELECT VALUE
2   COUNT(i.id)
3 FROM
4   Items i
5
```

Below the query editor, the 'Results' tab is active, showing a single result: a JSON array containing the value 1576. A red box highlights the 'Results' tab and the output.

I click on the “New SQL Query” icon at the top.
I write some code to test the count of the database.
The count returns 1576, which is correct.

Step 7 – Use Power BI to connect to Cosmos DB and create a data visualization

Notes

The screenshot shows the Power BI Desktop interface. The main window displays the 'Add data to your report' screen with the text 'Once loaded, your data will appear in the Data pane.' Below this, there are three cards: 'Import data from Excel', 'Import data from SQL Server', and 'Paste data into a blank report'. A 'Get data from another source' button is highlighted with a red box. A 'Get Data' dialog box is open in the foreground. The search bar in the dialog box contains the text 'cosmos'. Below the search bar, there are two categories: 'All' and 'Azure'. Under the 'All' category, there are two items: 'Azure Cosmos DB v1' and 'Azure Cosmos DB v2 (Beta)'. The 'Azure Cosmos DB v2 (Beta)' item is highlighted with a red box. At the bottom of the dialog box, there are two buttons: 'Connect' and 'Cancel'. The 'Connect' button is highlighted with a red box.

I open Power BI Desktop.
I sign in to my account.
I click "Get data" from another source.
I search for "cosmos."
I click on "Azure Cosmos DB v2 (Beta)."
I click "Connect."
Then I click "Continue."

Step 7 – Use Power BI to connect to Cosmos DB and create a data visualization - continue

Notes

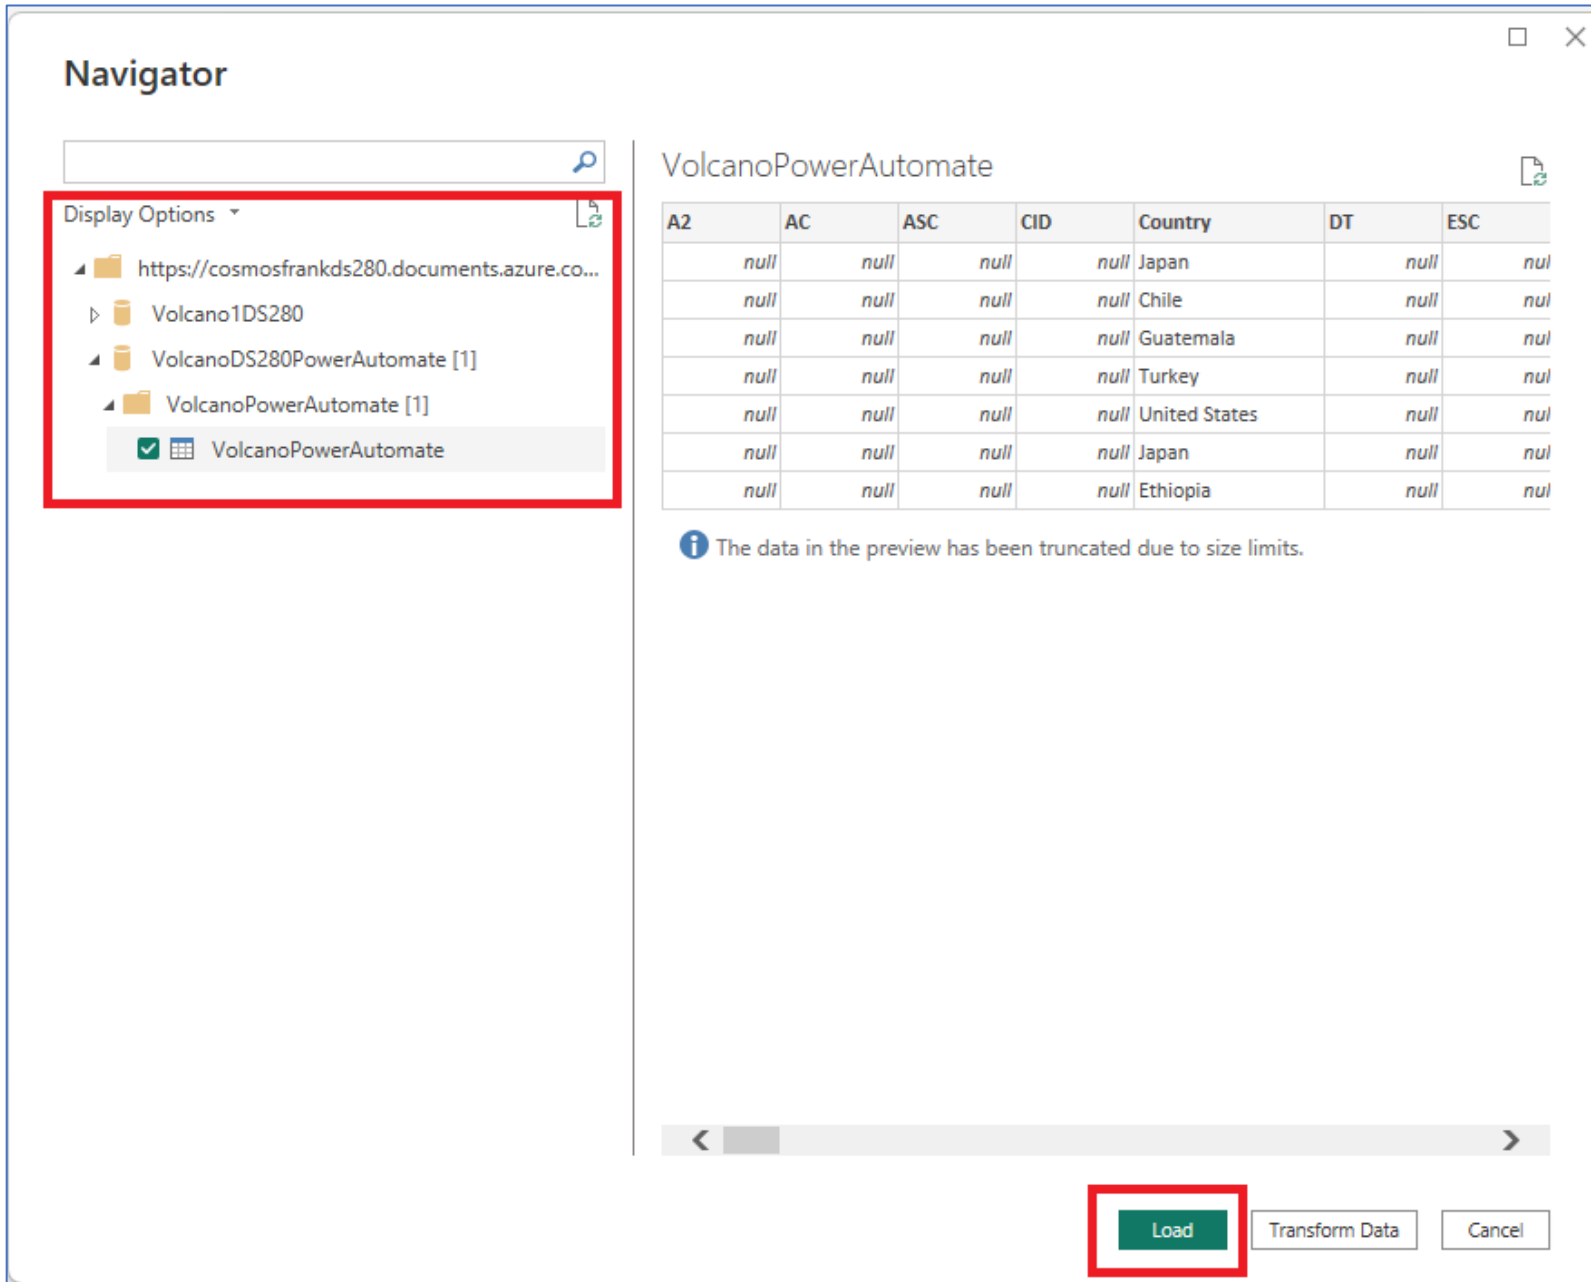

The screenshot shows the Power BI Desktop interface with the 'Add data to your report' dialog box open. The dialog box is titled 'Azure Cosmos DB v2' and has a close button (X) in the top right corner. It contains the following fields and options:

- Cosmos DB Endpoint:** A text input field containing the URL `https://cosmosfrankds280.documents.azure.com:443/`. This field is highlighted with a red rectangular box.
- Advanced Options (optional):** A section with three optional settings, each with a dropdown menu:
 - Number of Retries (optional):** A dropdown menu with the example value '10'.
 - Enable "AVERAGE" function Passdown (optional):** A dropdown menu with the example value '1'.
 - Enable "SORT" Passdown for multiple columns (optional):** A dropdown menu with the example value '0'.
- Data Connectivity mode:** A section with two radio button options:
 - Import:** Selected with a radio button.
 - DirectQuery:** Unselected with a radio button.
- Buttons:** At the bottom right, there are two buttons: 'OK' (highlighted with a red rectangular box) and 'Cancel'.

I copy the URI of my Cosmos account into the Cosmos DB Endpoint field.
I click OK.
I copy the Primary Key as well.
I click OK.

Step 7 – Use Power BI to connect to Cosmos DB and create a data visualization - continue

Notes

The screenshot shows the Power BI Navigator window. On the left, the 'Navigator' pane displays a tree view of data sources. The source 'VolcanoPowerAutomate' is selected and highlighted with a red box. The main area shows a preview of data from 'VolcanoPowerAutomate' with the following table:

A2	AC	ASC	CID	Country	DT	ESC
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	Japan	<i>null</i>	<i>nul</i>
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	Chile	<i>null</i>	<i>nul</i>
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	Guatemala	<i>null</i>	<i>nul</i>
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	Turkey	<i>null</i>	<i>nul</i>
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	United States	<i>null</i>	<i>nul</i>
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	Japan	<i>null</i>	<i>nul</i>
<i>null</i>	<i>null</i>	<i>null</i>	<i>null</i>	Ethiopia	<i>null</i>	<i>nul</i>

Below the table, there is an information icon and the text: 'The data in the preview has been truncated due to size limits.' At the bottom of the window, there are three buttons: 'Load', 'Transform Data', and 'Cancel'. The 'Load' button is highlighted with a red box.

I choose the Cosmos data from Power Automate.
I click Load.

Step 7 – Use Power BI to connect to Cosmos DB and create a data visualization - continue

Notes

I was able to create a simple visualization showing the count of countries. I added a filter with the top N (30) to display the top 30 countries with the most volcanoes.

Step 8 – Use Python to connect to Cosmos DB and create a data visualization

Notes

```
Python > cosmosanalysis.py > ...
1 from azure.cosmos import CosmosClient
2 import pandas as pd
3 import matplotlib.pyplot as plt
4 import seaborn as sns
5
6 # Replace with your Cosmos DB credentials
7 url = 'https://cosmosfrankds280.documents.azure.com:443/'
8 key = 'ba1bV5dxHYv1nLGJkuIxGaVxEC3s06kCQe8eiuzw2ryWlnje2kkqqm5qi5hX9Ie3j2L24GY034rMACDbxRNCCa=='
9 database_name = 'VolcanoDS280PowerAutomate'
10 container_name = 'VolcanoPowerAutomate'
11
12 # Initialize Cosmos client
13 client = CosmosClient(url, key)
14
15 # Access database and container
16 database = client.get_database_client(database_name)
17 container = database.get_container_client(container_name)
18
19 # Query data from Cosmos DB
20 query = "SELECT * FROM c"
21 items = list(container.query_items(query, enable_cross_partition_query=True))
22
23 # Convert data to DataFrame
24 df = pd.DataFrame(items)
25
26 # Check the first few rows of the dataframe
27 print(df.head())
28
29 # Count the number of volcanoes per country
30 country_counts = df['Country'].value_counts()
31
32 # Select the top 20 countries
33 top_20_countries = country_counts.head(20)
34
35 # Plot the horizontal bar chart
36 plt.figure(figsize=(12, 8))
37 sns.barplot(x=top_20_countries.values, y=top_20_countries.index, palette='viridis')
38 plt.title('Top 20 Countries with the Most Volcanoes')
39 plt.xlabel('Number of Volcanoes')
40 plt.ylabel('Country')
41 plt.show()
```

```
PS C:\Users\Frank\
\Desktop\COURSES\D
Volcano Name
0 Abu
1 Acamarachi
2 Acatenango
3 Acigol-Nevsehir
4 Adams

[5 rows x 43 column
PS C:\Users\Frank\
\Desktop\COURSES\D
Volcano Name
0 Abu
1 Acamarachi
2 Acatenango
3 Acigol-Nevsehir
4 Adams

[5 rows x 43 column
```

Here, I'm using **Python** to connect to **Cosmos DB** and to create a data visualization.

First I start by installing and importing some libraries.

```
from azure.cosmos import CosmosClient
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
```

Then I am getting the **URL**, **Primary Key**, my database and my container to connect to Cosmos DB.

```
url = 'https://cosmosfrankds280.documents.azure.com:443/'
key = 'ba1bV5dxHYv1nLGJkuIxGaVxEC3s06kCQe8eiuzw2ryWlnje2k
kqqm5qi5hX9Ie3j2L24GY034rMACDbxRNCCa=='
database_name = 'VolcanoDS280PowerAutomate'
container_name = 'VolcanoPowerAutomate'
```

Then, I initialize **cosmos client**, **Access database and container**, **Query data from Cosmos DB**, and **Convert data to dataframe**.

```
# Initialize Cosmos client
client = CosmosClient(url, key)

# Access database and container
database = client.get_database_client(database_name)
container = database.get_container_client(container_name)

# Query data from Cosmos DB
query = "SELECT * FROM c"
items = list(container.query_items(query,
enable_cross_partition_query=True))

# Convert data to DataFrame
df = pd.DataFrame(items)
```

Step 8 – Use Python to connect to Cosmos DB and create a data visualization - continue

Notes

```
# Check the first few rows of the dataframe
print(df.head())

# Count the number of volcanoes per country
country_counts = df['Country'].value_counts()

# Select the top 20 countries
top_20_countries = country_counts.head(20)

# Plot the horizontal bar chart
plt.figure(figsize=(12, 8))
sns.barplot(x=top_20_countries.values, y=top_20_countries.index, palette='viridis')
plt.title('Top 20 Countries with the Most Volcanoes')
plt.xlabel('Number of Volcanoes')
plt.ylabel('Country')
plt.show()
```

Then I print the first 5 rows of the dataframe to check.

```
# Check the first few rows of the dataframe
print(df.head())
```

Then I create a simple data visualization using the libraries.

I count the volcanoes by each country.

I display the top 20 countries with the most volcanoes.

I assign the size, x and y axes, and colors of the bars.

I add a title, x-axis title, and y-axis title.

Finally, I display the data visualization using the `plt.show()` function.

```
# Count the number of volcanoes per country
country_counts = df['Country'].value_counts()
```

```
# Select the top 20 countries
top_20_countries = country_counts.head(20)
```

```
# Plot the horizontal bar chart
plt.figure(figsize=(12, 8))
sns.barplot(x=top_20_countries.values, y=top_20_countries.index,
palette='viridis')
plt.title('Top 20 Countries with the Most Volcanoes')
plt.xlabel('Number of Volcanoes')
plt.ylabel('Country')
plt.show()
```

```
[5 rows x 43 columns]
PS C:\Users\Frank\Desktop\COURSES\DS 210\Python> python -u "c:\Users\Frank
\Desktop\COURSES\DS 210\Python\cosmosanalysis.py"
   Volcano Name  Country  Region  ...  CID  DT  PK
0           Abu    Japan  Honshu-Japan  ...  NaN  NaN  NaN
1   Acamarachi    Chile  Chile-N  ...  NaN  NaN  NaN
2   Acatenango  Guatemala  Guatemala  ...  NaN  NaN  NaN
3  Acigol-Nevsehir    Turkey  Turkey  ...  NaN  NaN  NaN
4           Adams  United States  US-Washington  ...  NaN  NaN  NaN

[5 rows x 43 columns]
```

Step 8 – Use Python to connect to Cosmos DB and create a data visualization - continue

Notes

Here is the final result of the data visualization of the JSON volcanoes database using Python and some libraries to connect to Azure Cosmos DB. I know I didn't have to do this last step (using Python), but I did it for fun.
